Counsel

"We have a vaccine for 9*-year-olds that prevents against six types of cancer. I recommend they get this safe vaccine today and then come back in 6 to 12 months to get the second dose."

*Adjust to the age of the patient

Listen

Allow time for the parent to state their concerns or questions, then restate or explore what they said.

Empathize

Acknowledge, validate, or normalize the parents' concern or experience.

Answer

Answer their questions. See tips for answering common questions on the reverse side of the card.

Recommend

"Because the HPV vaccine prevents against six types of cancer, I strongly recommend that your child receive it today."

TIPS FOR ANSWERING PARENTS' QUESTIONS ABOUT **the HPV Vaccine**

1. Is it safe?

"Yes, HPV vaccination is very safe. Like any medication, vaccines can cause side effects, including pain, swelling, or redness where the shot was given. That's normal for the HPV vaccine too and should go away in a day or two."

2. What are the side effects?

"The HPV vaccine, like any vaccine, can cause injection site pain, swelling, or redness. Some adolescents may have a headache or even faint after they get shots, so we recommend the patient stay seated during vaccination."

3. Why 9- to 12-year-olds?

"The HPV vaccine works better at younger ages. If your child gets the vaccine today they will only need 2 doses, but if we wait until they are older they may need 3 doses instead."

4. How well does it work?

"Clinical trials show that the vaccine is 97-100% effective in preventing HPV cancers. Since the vaccine's release in the US, HPV infection rates have decreased by 89%."

5. How much does it cost?

"Most 9-12-year-olds can receive this vaccine free, whether covered by insurance or not."

6. My child isn't having sex.

"Vaccines protect your child before they are exposed to a disease. That's why we give the HPV vaccine earlier, rather than later, to protect them long before they are ever exposed."
